

RESIDENT FIRE SAFETY INFORMATION

Stay Put

Fire safety in your home

As a landlord, Babergh and Mid Suffolk District Councils are required by law to provide fire safety advice to some of our residents.

We also have a duty to take general fire precaution measures to ensure, as far as is reasonably practicable, the safety of the people on our premises and in the immediate vicinity.

As a tenant you also have a part to play, and it is your responsibility to cooperate with us and follow our guidance to ensure the safety of yourself and others.

If relevant to your building, we will provide you with an 'easy to read' version of the fire risk assessment which can be requested by emailing our Compliance team:

firesafety@baberghmidsuffolk.gov.uk

1. Ensure you know what to do in an emergency!

Evacuating your home in the event of a fire:

It is extremely important that you know what the evacuation procedures are for your home and the building you live in, and that you know what to do in the event of a fire.

Evacuation procedures for flats, blocks and buildings are explained on the fire action notices displayed in the communal areas.

If you have a fire in your home, you must evacuate immediately and call 999.

Plan:

In the event of a fire, every second counts, so it is important that you know your escape route.

You should make sure everyone in your home knows what to do, so practice with them.

Make sure keys are easily accessible and everyone knows where they are.

Practice using different routes. It could be possible during a fire that your usual escape route is blocked, make sure you know alternative routes.

For further advice visit Suffolk Fire and Rescue Service:

www.suffolk.gov.uk/suffolk-fire-and-rescue-service

2. Evacuation Strategy for your building

'Stay Put' or 'Stay Put If Safe'

If there is a fire inside your flat or maisonette,

- Alert everyone in the flat,
- Leave the property and close all doors.
- Follow your pre-determined escape plan – or your alternative route
- If there is a lot of smoke in the flat consider crawling along the floor, where the air should be clearer and the temperature cooler.
- Lifts (if there is one) should not be used to evacuate.
- Call 999 as soon as you are in a safe place.

If there is a fire elsewhere in the building, the structure of the flat (walls, floors, and doors) are designed to keep you safe.

If there is a fire in your building but not inside your home, you are generally safer to 'stay put' in your flat, unless the heat or smoke from the fire are affecting you.

If you 'stay put' you should immediately call 999 and make them aware you are in the building – it is important that the fire rescue service and emergency crews attending are notified.

Once a 999 call is made, and firefighters arrive at the fire, follow the instructions given.

3. Fire Door Safety

Fire doors are a very important life saving measure - they will hold back smoke and fire to help save lives.

Fire doors provide a level of protection as they are made from materials that work together to slow down or stop the spread of fire in your home and will hold back fire for at least 30 minutes – some doors are rated for longer.

As with all fire safety measures, fire doors need to be kept in good working order and in good repair otherwise the door will not work properly.

Here are some do's and don'ts for fire doors.

Do's

- **Keep fire doors shut when not in use.**
- **Keep fire doors free from any obstructions, the space in front and behind a fire door should always be kept clear.**
- **Report any fault or damage immediately, for yours and others' safety.**

Don'ts

- **Do not wedge open fire doors at any time.**
- **Do not disconnect or tamper with self-closing devices.**
- **Do not change or alter fire doors in any way, this includes decorating doors with signs or wreaths as well as adding coat hooks.**
- **Do not adjust or replace Fire resistant hinges.**

If you suspect a fire door is damaged or faulty, there are a few simple checks you can carry out to check the fire door is operating safely.

- **Does the door fully close? Open the door halfway, let it go and allow it to close. It should close onto the latch without sticking to the frame.**
- **Are there large gaps around the door? Gaps around the top and side of the door should be consistently less than 4mm when the door is closed. The gap under the door can be slightly larger, but ideally you shouldn't be able to see light under the door.**
- **Are there any damaged seals around the door or the frame. These will be plastic or brushed strips imbedded in the door or the frame.**

REMEMBER

If you notice a fire door is damaged, not closing properly, has a defect or you are simply unsure it is in good working condition, report it immediately to 0300 123 4000.

3. Oxygen storage Safety

We are required by law to identify, manage and mitigate risks associated with fire, including guidance to residents storing oxygen.

Oxygen safety is important for individuals who require supplemental oxygen therapy, it can be lifesaving and beneficial.

However, it also presents additional safety issues, due to the potential risks associated with oxygen use.

If you use and/or store oxygen in your home, please let us know for our records and so we can inform the Fire Service.

By following these oxygen safety guidelines, individuals using oxygen therapy can minimise risks and ensure the safe and effective use of their oxygen equipment.

No Smoking - keep all sources of ignition away from oxygen, including smoking, open flames, candles and gas cookers. Oxygen is highly flammable and can cause fire or explosions.

Keep clear of heat sources - do not place oxygen equipment near heat sources such as radiators, heaters or direct sunlight.

No petroleum-based products – avoid using petroleum-based skin products (e.g. petroleum jelly, oil-based lotions) around your face or nasal cannula to prevent fire hazards.

Wear cotton clothing - choose clothing made of natural fibres like cotton. Avoid wearing synthetic fabrics that can generate static electricity.

Avoid electric blankets - do not use electric blankets or heating pads while using oxygen therapy, as they can pose a fire risk.

Maintain distance from Electrical devices - keep a safe distance from electrical devices that may generate sparks, such as electric razors or hair dryers.

Secure oxygen during travel - ensure that oxygen cylinders are securely positioned during travel to prevent tipping or damage.

Train Family Members - educate household members about oxygen safety, especially if they assist with caregiving.

Signage

If you would like us to supply you with oxygen safety sign, to display in your home, contact us via email at:

firesafety@baberghmidsuffolk.gov.uk or telephone 0300 123 4000.
